NOCTURNE

AI matchmaking for DJs and venues

Pablo Penalba

April 30, 2026

THE PROBLEM

Booking a DJ is blind.

01
Venues book without preview

Promoters pick from EPKs, demo mixes, and Instagram, then hope the vibe lands. By the night of the show, course-correction is impossible.

02
DJs pitch into voids

Hours spent emailing venues that never reply, or worse, venues whose crowd doesn't fit the set. Booking signal is sparse and one-directional.

03
No preview of the night

There's no medium that lets venues, DJs, and crowds preview the actual sonic and visual character of the show in advance.

WHY AI, NOT JUST CHATGPT

Vibe is fuzzy and multi-modal: genre-tag overlap, BPM windows, room atmosphere, capacity, and bio context all need joint reasoning. ChatGPT alone has no roster, no audio analysis, and no media generation. The platform owns the data and stitches the AI stack together.

LIVE DEMO

From upload to venue simulation.

1

Upload track + photos + style

30-second audio sample (trimmed client-side), performer photos, and a one-line style description.

2

AI matches you to a venue

An audio model reads the track's style; the matcher ranks 7 venues with reasoning over genre, vibe, capacity, and bio context.

3

AI generates the night

Music preview clip per matched venue plus a 10-second cinematic venue simulation conditioned on the room's photo. Soundtrack syncs in the browser.

WATCH IT LIVE

Switching to the browser.

/personal-demo.html

Real-time venue match, AI music preview, and venue simulation.

One stack · swappable models · ~$0.05 per personalized run

USER STUDY

First-user walkthrough.

WHO TESTED IT

Santiago Vuilleumier

Miami DJ; founder & curator, Casa Whispers

Protocol:

- Uploaded a 30-second sample of a recent set
- Provided photos and a free-text style description
- Reviewed the top-3 venue ranking and reasoning
- Played the AI music preview and venue simulation
- Talked through perceived fit and confidence after

WHAT'S NEXT

Broader study

Same protocol, wider sample, post-presentation.

Plan:

- 3 to 5 working DJs across genres
- 2 to 3 venue managers / promoters
- Same protocol; blind ratings of top-3 matches
- Mix of audio uploads and typed-style entries
- Capture quotes for a follow-up writeup

n=1 walkthrough with Santiago Vuilleumier (Casa Whispers, Miami). Specific observations to be captured in the broader study.

EVALUATION

How we know it’s working, or not.

§9.3 DJ-MATCH BLIND EVAL · 21 (VENUE, DJ) PAIRS · HUMAN-RATED 1 TO 5

3.71 / 5.00
Match Precision
target ≥ 4.00

28.6%
Rank Accuracy (top-1)
target ≥ 70%

2 / 7
Top-1 matched human pick
FABRIC LONDON · THE NEST

FAILURE MODE THE EVAL CAUGHT, PRE-DEPLOYMENT

Matcher over-weights genre tags and ignores DJ bios. AELXIS VOX gets pushed to industrial venues despite a bio describing cinematic festival sets.

§9.3 DJ-MATCH

Live · numbers above

21 blind-rated pairs. Both targets missed; failure mode caught. Iteration planned.

§9.4 AUDIO-DRIVEN MATCH

Harness ready · samples pending

Paired typed-style vs typed+audio protocol on 7 venues. Sample collection in progress.

§9.5 PROMPT-STRUCTURE LINTER

3 / 3 venues PASS · 15 / 15 checks each

Deterministic linter for Seedance prompt structure. $0 to run, fits CI.

§9.6 VIDEO OUTPUT RUBRIC

1 / 3 generated · ratings pending

5-dim rubric (identity, fidelity, action, camera, behavior) plus constraints check. ~$1.51 / venue.

The eval did its job: it caught a real failure mode before any user saw it.
